Terms of use The use of the software within a company, under an OEM license, is only allowed for the product created by the manufacturer. Use of commercial software of a third-party manufacturer is prohibited, even if this software is combined with the Open CASCADE development team. It is recommended that the EULA of the corresponding software be read in advance. Licensing The licensing of the GSI software is not done as a commercial agreement, but as a special additional fee for the Open CASCADE development team. The software is licensed to users via a maintenance contract. The size of the customer base, both on a regional and national scale, determines the interest of the Open CASCADE development team and the attractiveness of a license. The license cost is determined on the basis of the number of users. The individual license key is given to the customer, who can then renew the license at any time. If the customer cancels the contract, the software license must be returned to the development team. After being checked, the software license must be re-distributed. Licenses for the GSI software are transferred exclusively via InterSystems Technology Corporation. The maintenance contract can be set up, via the website of InterSystems Technology Corporation, on the basis of the current version of the GSI software. If the customer wants to install a new version, a new license must be purchased. File size The file size of the license, which is necessary for installation on a network, is between 18.1 and 32.5 MB depending on the number of users. The file size of the key, which is distributed to the user on the basis of the license, is around 0.9 MB.
